EXP-002 — Re-Engagement Notification Language Test

PLANNED

Linked Hypothesis: HYP-004 — Language frame drives higher day-3 return rate
Linked Initiative: INI-002 — Progress tracking (visible improvement)
Owner: Dana Avraham (design) · Yael Shapiro (copy) · Ron Mizrahi (infra, <0.5d eng)
Window: 2026-03-10 → 2026-03-31 · Early read: 2026-03-17 · Last updated: 2026-03-05

METHOD

3-arm push notification test — ~33% per arm of all day-3 inactive players (no app open since signup day).

> **ARM A — CONTROL (CURRENT COPY)**
> *"Time to practice your basketball drills 🏀"*

> **ARM B — ACHIEVEMENT FRAME · FROM INT-001 SIGNAL ("BEAT YOUR OWN NUMBER")**
> *"You're 1 drill away from a 3-day streak. Don't break it."*
> Players with 0 completions: "Your first streak starts today."

> **ARM C — DIRECTIVE FRAME · FROM INT-002 SIGNAL ("JUST TELL ME WHAT TO DO")**
> *"Today's drill: Crossover Basics — takes 3 minutes."*
> Personalised to last drill in queue; fallback: "Ball Handling Basics"

WHO'S IN TEST

CRITERIA	DETAIL
Audience	New players (Ben-type) who have NOT opened the app since day 1
Trigger	Day-3 only — not day-5 or day-7 re-engagement flows
Platform	iOS and Android, mobile only
Minimum sample	200/arm for significance at 80% power
Excluded	Players who returned organically on days 2–3

PRIMARY METRIC

BASELINE (CONTROL)	SUCCESS THRESHOLD	FAILURE THRESHOLD

~18%	≥21.6%	<+10%
Day-3 return rate	+20% lift in winning arm	Across both treatment arms

Definition: % of notified players who open app + complete ≥1 drill within 24 hours of notification.

SECONDARY METRICS

- **Notification open rate** — measures headline copy impact independent of CTA
- **Drill completion rate on return session** — did they just look, or actually practice?
- **Day-7 return rate** — does the language effect persist beyond the initial trigger?

RISKS BEING WATCHED

- Arm B presupposes a streak — players with 0 completions need fallback copy variant; requires personalisation logic in notification service.
- Arm C requires knowing the next queued drill; fallback copy needed if queue is empty.
- Small cohort risk: if weekly signups drop, arms may not hit 200 minimum by day 21.

DECISION POINTS

Day-7 read — 2026-03-17

≥+30% in one arm
Consider early call — skip day-21 read and roll immediately.

Day-21 read — 2026-03-31

≥+20% lift
Roll winning arm to 100% of day-3 re-engagement. Update all notification copy.

+10–20% lift
Extend 14 days and broaden to day-5 and day-7 triggers to compound the effect.

<+10% across both arms
Close experiment. Root cause is likely pre-notification. If open rate <15%, fix notification permission prompt at onboarding first.
